- Return 1 or Return 0 means what and the main return to whom.

return 1: Returns the value 1 to the calling function. It usually means True, found or success.

return 0: Returns the value 0 to the calling function. It usually means False, Not found, or failure.

In C/C++, the main() function returns its value to the operating system (os). return 0; indicates that the program executed successfully. In Java, main() is void, so it does not return any value.
